

RIVO MULTITRADE OPTICAL SYSTEMS

1-core indoor optical cable processing

Overview

Single Core Tight Buffer Indoor Optical Cable Extrusion Machine We have professional processing equipment, and advance technology, skilled assembly workers.

Key Takeaways

1-core indoor optical cables are single-fiber cables designed for indoor use, featuring protective sheaths, aramid yarn reinforcement, and precise manufacturing processes to ensure performance and durability. Cable Structure and Materials

A typical 1-core indoor optical cable consists of a single optical fiber, often single-mode (G652B/D, G657) or multi-mode (OM3, A1a, A1b), surrounded by a tight-buffered layer for mechanical protection. The fiber is reinforced with high-modulus aramid yarn, which provides tensile strength and crush resistance, and is enclosed in a low-smoke zero-halogen (LSZH) sheath for safety in indoor environments. Some designs are non-metallic and environmentally friendly, with no internal glue filling, making them lightweight and easy to install.

Applications

These cables are widely used in optical communication equipment rooms, optical distribution frames, device leads, and indoor cabling for FTTH (fiber-to-the-home) networks. They are suitable for both indoor and controlled outdoor environments, providing reliable signal transmission while minimizing space requirements due to their small diameter.

Processing and Manufacturing

The production of 1-core indoor optical cables involves several key steps:

- **Fiber Drawing and Coating:** Optical fibers are drawn from preforms and coated with protective layers.
 - **Buffering:** The fiber is encased in a tight buffer to protect against mechanical stress.
 - **Strength Member Integration:** Aramid yarn is applied to provide tensile strength and prevent fiber breakage.
 - **Sheathing:** The LSZH or other high-performance sheath is extruded around the fiber and strength member.
 - **Quality Control:** Advanced machinery, such as that from Rosendahl Nextrom, monitors excess fiber length, stranding tension, and lay length in real time to ensure consistent quality and reduce scrap rates . Modern production lines allow high-speed, precise manufacturing with minimal downtime, producing cables suitable for indoor applications with stable performance and low insertion loss .
- Installation Considerations

1-core indoor cables are lightweight and flexible, making them easy to route through conduits, cable trays, or walls. Proper handling is essential to avoid micro-bends or fiber damage. Factory-terminated connectors or pigtails can be used to simplify installation and ensure optimal optical performance .

Summary

1-core indoor optical cables combine a single optical fiber with protective buffering, aramid reinforcement, and LSZH sheathing. They are manufactured using precise, monitored processes to ensure durability, low loss, and safety for indoor environments. These cables are ideal for FTTH, device connections, and indoor network infrastructure, with modern production equipment enabling high-quality, efficient manufacturing .
