

Energy-efficient BERT bit error rate meter for edge computing

Overview

The bit error rate of a data link – for example, a fiber-optic link – is the average fraction of wrongly transmitted bits.

Key Takeaways

Energy-efficient BERT testing for edge computing can be achieved by combining low-power hardware accelerators, quantized model inference, and compact Bit Error Rate Testers (BERTs) optimized for high-speed, low-jitter measurements. Conventional BERT Hardware

High-performance Bit Error Rate Testers (BERTs) such as the Semight MBT5210 and PBT8812/PBT8812B are designed for precise error measurement in high-speed serial links. The MBT5210 supports data rates from 9.953 to 28.2 Gbps, with low inherent jitter, fast rising edges, and standard pseudo-random bit sequences (PRBS) for testing signal integrity. The PBT8812 series extends this to 400/800 GbE and CEI-112G standards, supporting PAM4 and NRZ signals with ultra-fast BER sampling (
