Fiber Optic Single-Mode Dual-Fiber Transceiver

Overview

The Difference Between Single/Dual Fiber and Understanding the distinction between single vs. dual fiber and single-mode vs. multi-mode Difference Between.

Key Takeaways

A single-mode dual-fiber transceiver uses two separate fibers—one for transmitting and one for receiving data—enabling stable, long-distance optical communication. Overview

A dual-fiber optical transceiver is designed for single-mode fiber networks, where one fiber strand is dedicated to transmitting (TX) and the other to receiving (RX) data . This setup ensures high transmission stability, minimal signal interference, and reliable performance over long distances, making it ideal for backbone networks, metro networks, and large-scale deployments . Dual-fiber transceivers typically use a duplex LC interface, which aligns with standard network designs and simplifies cabling .

How It Works

- **Transmission and Reception:** Each fiber carries a single wavelength; one fiber transmits data while the other receives it.
- **Wavelength:** Common single-mode wavelengths include 1310 nm and 1550 nm, optimized for long-distance communication .

- **Signal Conversion:** The transceiver converts electrical signals from network devices into optical signals for transmission and converts incoming optical signals back into electrical signals for the device .

Advantages

- **High Reliability:** Separate fibers for TX and RX reduce crosstalk and signal interference.
- **Long-Distance Capability:** Single-mode fibers allow transmission over tens of kilometers without significant signal loss .
- **Compatibility:** Works with standard duplex LC cabling and most network switches or routers.
- **Scalability:** Supports high-bandwidth applications and can be integrated into growing network infrastructures .

Comparison with Single-Fiber (BiDi) Transceivers

Feature	Dual-Fiber Transceiver	Single-Fiber (BiDi) Transceiver
Fiber Usage	Two fibers (TX and RX)	One fiber for bidirectional communication
Interface	Duplex LC	Simplex LC
Wavelength	Single wavelength per fiber	Uses WDM with two wavelengths (e.g., 1310/1490 nm)
Distance	Long-distance, stable	Efficient for fiber-scarce environments, moderate distance
Complexity	Simple design, standard deployment	Requires matched BiDi pairs and wavelength planning
Cost	Lower per-transceiver cost	Higher per-transceiver cost due to WDM technology
Applications		

Dual-fiber single-mode transceivers are commonly used in:

- Long-haul backbone networks
- Data center interconnects
- Metro area networks (MANs)
- High-bandwidth enterprise networks They are preferred when fiber resources are abundant and network reliability and stability are critical . In summary, a single-mode dual-fiber transceiver provides a robust, long-distance solution for optical networks, offering high stability, standard duplex interfaces, and compatibility with high-speed network devices, making it a reliable choice for large-scale and backbone deployments.

Difference Between Single and Dual Fiber Optical Transceivers

Know the key differences between Single and dual-fiber optical transceivers for efficient network deployment and

SFP optical transceivers

Home 1.25G SFP (Gigabit) Dual Fiber Dual Fiber Regular SFP optical transceivers use two fiber strands to operate. This category

Differences Between Single-mode & Multimode Fiber Optic Transceivers ...

The transmission distance of multimode fiber optic transceiver is less than that of the single-mode transceiver due to

Choosing the Right SFP: Single Fiber vs Dual Fiber

What Is a Dual Fiber SFP? Dual fiber SFPs are the traditional and more widely used type of optical transceivers.

Single Mode SFP Transceiver: Complete Guide Explained

Learn what a single mode SFP transceiver is, how it works, key specs, common types, and real-world use cases for long-distance

Single Mode vs Multimode Fiber, What is The Difference?

Learn the key differences between single mode vs multimode fiber cables and choose the right one for your fiber optic

SFP Optical Transceiver | SFP Optical Module | Perle

Perle SFP Optical Transceivers are hot-swappable, compact media connectors that provide instant fiber connectivity for your

Single Mode to Multimode Converters | Fiber to Fiber

Easily connect different fiber types and wavelengths to convert Single Mode to Multimode (SM to MM), or extend the distance of

fiber optic cable multimode versus singlemode duplex vs simplex

Use duplex multimode or singlemode fiber optic cable for applications that require simultaneous, bi-directional data transfer.

Single-mode vs. Multimode Transceivers: How Do You Choose?

Most fiber systems use a transceiver, which combines a transmitter and receiver into a single module, using fiber

H!Fiber 10G Single Mode SFP+ LC Module, 10GBase-LR Fiber Transceiver ...

H!Fiber offers one-stop Datacenter solution and products, including SFP Transceivers, DAC Cables, Network Card,

Complete Guide to Choosing the Right 100M Optical Transceiver

This guide will demystify the key selection criteria— Single-mode vs. Multi-mode and Single-fiber vs. Dual-fiber —to

What Is A Single-Fiber BiDi Transceiver?--ETU-LINK

When planning a fiber optic network,one key decision is choosing between single-fiber (BiDi) and dual-fiber optical transceivers. This

Single vs Dual Fiber Media Converters (2025): A/B Pairing and WDM

Whether you choose single-fiber BiDi for fiber savings or dual-fiber for simplicity, the fundamentals are the same: match

Broadbe Optical Module 10G Single-Mode 10km | Getic

The Single-Mode Dual Fiber optical transceiver series is designed for reliable high-speed data transmission over long distances
