

RIVO MULTITRADE OPTICAL SYSTEMS

How to select surge protection models for distribution boxes

Overview

Distribution arresters play a crucial role in surge protection by safeguarding electrical systems against voltage spikes.

Key Takeaways

Selecting the right SPD for a distribution box requires matching the device type, voltage and current ratings, and installation location to your system's protection needs.

Step 1: Determine the Type of SPD

SPDs are classified into three main types based on their installation location and protection level:

- Type 1 (Class I): Installed at the main service entrance, designed to handle high-energy surges from direct lightning strikes or utility switching operations ().
- Type 2 (Class II): Installed in sub-distribution panels or downstream of Type 1 SPDs, protecting against residual overvoltages and internal operational surges ().
- Type 3 (Class III): Installed near sensitive end devices, providing precision transient voltage suppression for low-level surges (). For distribution boxes, Type 2 SPDs are typically used, unless the box is at the main service entrance, in which case Type 1 may be required ().

Step 2: Assess Voltage Ratings

Key voltage parameters include:

- Nominal System Voltage (U_n): Ensure the SPD is compatible with your system voltage (e.g., 230V single-phase, 400V three-phase) ().
- Maximum Continuous Operating Voltage (U_c or MCOV): The SPD must withstand the highest voltage expected during normal operation without degradation ().
- Voltage Protection Level (U_p): The clamping voltage that the SPD allows downstream equipment to experience; lower U_p is critical for sensitive electronics ().

Step 3: Evaluate Current Ratings

- Nominal Discharge Current (I_n): The current the SPD can safely handle repeatedly without damage ().
- Maximum Discharge Current (I_{max}): The highest surge current the SPD can withstand during extreme events, such as lightning strikes ().
- Short-Circuit Current Rating (SCCR): Must meet or exceed the upstream breaker rating to ensure safe operation ().

Step 4: Consider Installation Location and Coordination

- Install SPDs as close as possible to the distribution panel to minimize voltage drop and protect downstream equipment ().

- For layered protection, use a cascading approach: Type 1 at the service entrance, Type 2 in sub-panels, and Type 3 near sensitive loads ().

- Ensure the SPD enclosure fits the physical space of the distribution box and allows for proper maintenance ().

Step 5: Compliance and Standards

- Verify that the SPD complies with IEC/EN 61643-11 or UL1449 standards ().

- Consider the building's lightning protection level (LPL) to determine the required limp rating for Type 1 SPDs ().

Step 6: Additional Considerations

- Response Time: Modern MOV-based SPDs should have a response time below 25 ns to protect sensitive electronics ().

- Environmental Factors: Ensure the SPD is rated for the installation environment, including temperature, humidity, and potential exposure to dust or moisture (). By carefully evaluating these factors—SPD type, voltage and current ratings, installation location, and compliance with standards—you can select a surge protection model that effectively safeguards your distribution boxes and connected equipment.

Surge Protector Buying Guide

Learn how surge protectors guard equipment against power surges, what joule ratings mean, how long surge protectors last and

Surge Protection selection guide

Surge Protection selection guide The below tables were designed to make the selection of the surge protection devices for your

Selection of Surge Protective Devices

Choosing a suitable surge protective device requires some effort to access the target

How to Select the Right SPD: Complete Selection Guide

This guide explains how to select the right SPD for typical applications: distribution panels,

How To Select Surge Protector For Distribution Box?

In order to help you correctly select a surge protector for a distribution box, this article will provide you with a detailed

How to Pick the Best Surge Protector (2026)

I spoke to experts and did extensive research to uncover what matters most when choosing

How to choose the right surge protector?

Check out our Surge Protection Device Selector to better know about how to pick a surge protector and circuit

Surge Protection Device Selection and Coordination

Learn how to select and coordinate surge protection devices for optimal safety and efficiency in power distribution panels on

Surge Protective Device Guide: Type 1 vs Type 2 SPD, TVSS, AC/DC

A Type 2 surge protection device is often used at main or sub-distribution boards. For many commercial buildings,

How to Choose the Right Surge Protection Device (SPD) for panels

In this guide, we explore how to choose surge protection devices for electrical panels and ensure reliable protection for

Detailed Explanation of Tiered Surge Protection for Distribution Boxes

In lightning protection, the surge protection device in distribution boxes plays a crucial role. According to the principle of graded

Distribution Panel Surge Protection

Distribution panel surge protection in industrial facilities is a proactive measure that protects electrical infrastructure, minimizes

Surge protection devices: how to choose them?

How to choose the protection devices associated with the surge protective devices? Finally, the protection device associated with the

Eaton's Guide to Surge Suppression

Low-inductance connections should be employed for this protection. Eaton's Powerware surge protective devices can be fully

How to Select the Right Surge Protection Devices

When it comes to protecting appliances and electrical systems, surge protection is a necessary investment for all

Surge protection devices: how to choose them?

Surge protection devices: how to choose them? As everyone knows, surge protection devices or surge protective devices (SPD)

5 Types of Surge Arrester You Should Know

2. Intermediate Class Surge Arresters This type of surge arrester is often used in medium
