

RIVO MULTITRADE OPTICAL SYSTEMS

How were cables covered up when they extended beyond the cable tray

Overview

Only cables specifically rated for tray use - such as Type TC (Tray Rated) or Type MC (Metal-Clad) - are allowed.

Key Takeaways

Cables extending beyond a cable tray are typically protected using ER-rated cables, conduit, or protective covers to ensure mechanical safety and code compliance. ER-Rated Cables

When cables extend more than 1.8 meters (6 feet) beyond a tray, ER-rated (Exposed Run) cables such as TC-ER, ITC-ER, or PLTC-ER can be used. These cables are designed to withstand crush and impact tests, allowing them to be safely run outside the tray without additional conduit, provided they are adequately supported and secured. The ER rating ensures the cable jacket is rugged enough for exposed installation, reducing the need for armored cable or conduit.

Conduit and Raceways

For non-ER-rated cables, or when additional protection is required, conduits or other raceways are used to cover the cable as it exits the tray. This provides mechanical protection against impact, abrasion, and environmental hazards. Conduits are particularly important in areas prone to physical damage or where code requires additional protection.

Protective Covers and Supports

Cables extending beyond trays can also be shielded using protective covers, such as solid or perforated covers, especially in outdoor or high-risk environments . Proper support is critical: cables should be secured with nylon straps, metal clips, or binding wires at bends, joints, and intervals along the run to prevent sagging or mechanical stress . For vertical runs near the ground, protective covers are recommended within the first 2 meters to prevent damage.

Installation Considerations

- Maintain minimum clearances from corrosive or thermal pipelines, using insulation boards or corrosion-resistant plates where necessary .
- Ensure cables are supported at regular intervals (typically 1.5–3 meters) to prevent excessive deflection .
- When transitioning from indoor to outdoor or fireproof environments, seal the wall penetration and provide rainproof measures to prevent water ingress .
- Use conduit or covers in areas prone to mechanical damage, dust, or environmental hazards . By combining ER-rated cables, conduit, protective covers, and proper support, cables extending beyond trays can be safely installed while complying with NEC standards and minimizing the risk of mechanical or electrical failure .
