Is the lc connector a round pin

Overview

Optical fiber connectors are used to join optical fibers where a connect/disconnect capability is required. Due to the polishing and tuning procedures that may be incorporated into optical connector manufacturing, connectors are often assembled onto optical fiber in a supplier's manufacturing facility. However, the assembly and polishing operations involved can be performed in the field, for example, to terminate long runs at a patch panel.

Key Takeaways

LC connectors do not have a protruding round pin; they use a small cylindrical ferrule to align the fiber.

LC (Lucent Connector) is a small-form-factor fiber optic connector widely used in data centers, telecom, and LANs for both singlemode and multimode fibers . Unlike ST connectors, which feature a round body with a bayonet-style lock, LC connectors have a square or rectangular housing with a push-pull latch mechanism and a cylindrical ferrule that holds the fiber in precise alignment . The ferrule itself is typically made of ceramic and is not a protruding pin, but a smooth cylinder that ensures minimal insertion loss and accurate optical alignment .

Key Features of LC Connectors

- **Ferrule Geometry:** LC connectors use a 1.25 mm diameter ferrule to hold the fiber, which is smaller than SC connectors (2.5 mm ferrule), allowing higher port density .
- **Housing:** Compact, robust, and designed for push-pull operation, making installation and removal easy without twisting .

- Polish Types: Available in LC/PC and LC/APC variants, with APC having an 8° angled endface to reduce reflections .

- Applications: Common in SFP/SFP+ transceivers, high-density patch panels, and duplex fiber links from 10G to 400G .

Comparison with Other Connectors

- ST Connector: Round ferrule with bayonet lock; older design.

- SC Connector: Square push-pull housing with larger ferrule; less dense than LC.

- FC Connector: Round metal body with screw-threaded connection; used in telecom and long-haul networks. In summary, LC connectors use a cylindrical ferrule rather than a round pin, and their compact design supports high-density fiber optic installations while maintaining precise alignment and low signal loss .
