Requirements for the placement of civil defense power distribution boxes

Overview

Codes & Specifications For the latest information or questions regarding specific requirements, please contact your LADWP service planning representative.

Key Takeaways

Civil defense power distribution boxes should be installed in dry, accessible, ventilated locations, protected from environmental hazards and at a standard height for safe operation.

Accessibility: Distribution boxes must be easily reachable for electricians, maintenance personnel, and emergency responders. They should be visible and free from obstructions to allow quick inspection, maintenance, or repair . **Environmental Protection:** Boxes should be installed in areas protected from moisture, dust, corrosive gases, smoke, and direct exposure to rain or sunlight. For outdoor installations, weatherproof enclosures with appropriate IP or NEMA ratings are recommended . **Indoor locations** should avoid areas prone to flooding or high humidity . **Height and Ventilation:** Typically, boxes are mounted at approximately 1.5 meters above the floor to ensure ergonomic access. Adequate ventilation is necessary to prevent overheating and maintain long-term reliability . **Safety from Physical Hazards:** Avoid locations exposed to strong vibrations, mechanical impact, heat sources, or splashing liquids. If unavoidable, special protective measures should be applied . **Proximity to Loads:** Sub-distribution boxes should be installed near concentrated electrical loads, with distances from switch boxes not exceeding 30 meters horizontally, and from controlled equipment not exceeding 3 meters . This minimizes voltage drop and improves system efficiency. **Separation of Circuits:** Power and lighting circuits should be separated within the distribution system, and neutral and protective earth lines should be properly terminated on separate terminal boards . **Future Expansion and Capacity:** Choose locations that allow for future upgrades or additional circuits. Ensure sufficient space for wiring, breakers, and surge protection devices . **Temporary Installations:** On construction sites or emergency setups, portable distribution boxes should use modular, waterproof, and standardized connectors to maintain safety and flexibility under changing conditions . By following these guidelines, civil defense power distribution boxes can be installed safely, ensuring reliable operation, compliance with standards, and ease of maintenance.
