

RIVO MULTITRADE OPTICAL SYSTEMS

The distribution box should have legs underneath

Overview

Distribution Box Mounting & Panel Installation Tips I recommend mounting the distribution box so controls and breakers are reachable from standing height wi.

Key Takeaways

Distribution boxes can be installed with legs underneath to improve stability, airflow, and maintenance access, especially for larger or industrial units. Installation Considerations

Legs or stands under a distribution box are not always mandatory but are often recommended for certain situations. They provide several benefits:

- **Stability and support:** For larger or heavier boxes, legs help distribute weight evenly and prevent tipping or damage to the enclosure or floor .
- **Airflow and cooling:** Elevating the box allows air to circulate underneath, reducing heat buildup and helping prevent overheating of internal components .
- **Ease of maintenance:** Legs create space for cleaning, inspection, and cable routing, making it easier to access the bottom of the box and the wiring .

- **Protection from moisture:** In areas prone to dampness or minor flooding, legs keep the box off the floor, reducing the risk of water ingress and corrosion .
General Installation Guidelines
- **Height from the floor:** For residential settings, the recommended height is about 1.5 meters from the floor to keep it accessible yet out of reach of children . Industrial installations may vary depending on equipment layout.
- **Clearance:** Leave sufficient space around the box for ventilation and future maintenance. This includes space above, below, and on the sides .
- **Grounding and safety:** Ensure the box is properly grounded, and all metal parts are connected to the earth to prevent electric shock .
- **Material and protection:** Choose a box with corrosion-resistant materials and appropriate IP or NEMA ratings for outdoor or humid environments .
Conclusion

While not all distribution boxes require legs, adding legs is a practical choice for larger, industrial, or outdoor boxes. It enhances stability, airflow, and maintenance access, and can protect the box from environmental hazards. For smaller residential boxes, wall-mounted installations without legs are typically sufficient, provided proper height and clearance are maintained .
