

When are cable trays installed

Overview

A Guide to Installing and Supporting Electrical Cable Trays This guide covers the critical steps, from selecting the right electrical cable tray and perform.

Key Takeaways

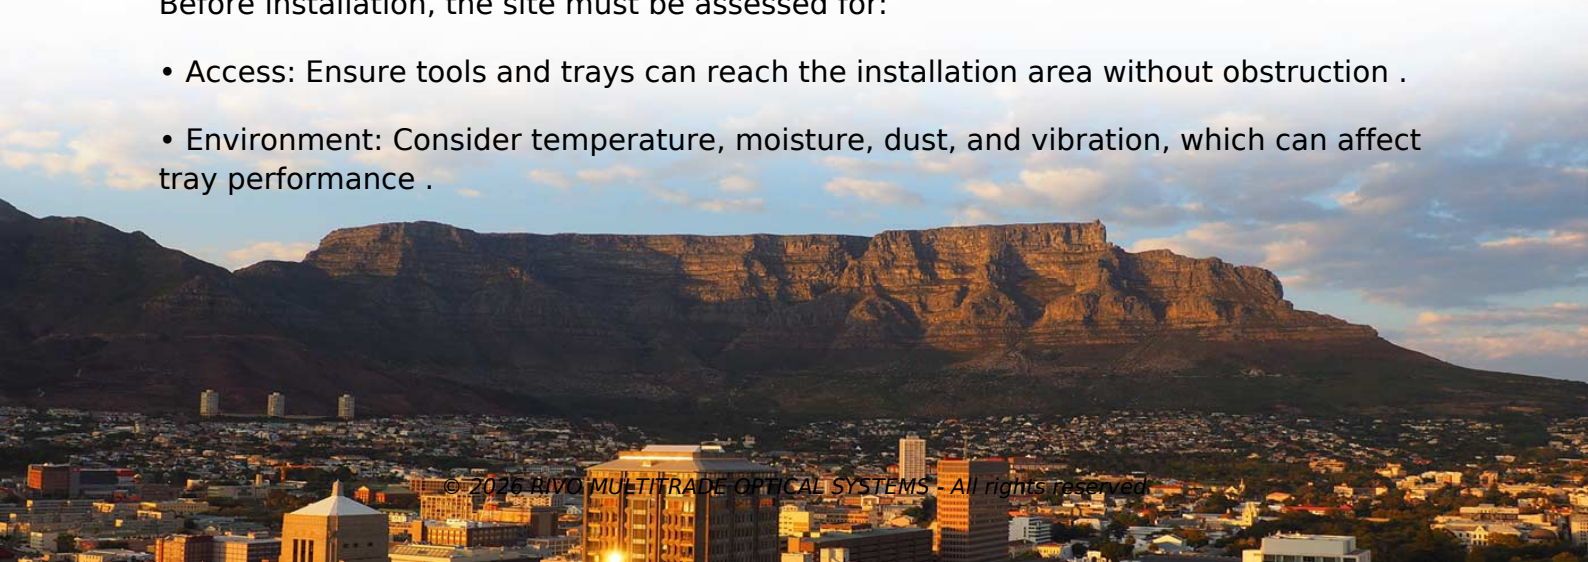

Cable trays are typically installed after structural elements are in place but before major electrical wiring is pulled, ensuring proper support, accessibility, and compliance with NEC standards. Timing in Construction

Cable trays are generally installed once the building's structural framework is complete—walls, ceilings, and floors are in place—but before the bulk of electrical cables are run. This allows trays to be securely mounted to walls, ceilings, or floors and ensures that the tray route is clear and accessible for future maintenance or cable additions . Installing trays too early can risk damage during construction, while installing them too late can complicate cable routing and violate clearance requirements .

Planning and Preparation

Before installation, the site must be assessed for:

- Access: Ensure tools and trays can reach the installation area without obstruction .
- Environment: Consider temperature, moisture, dust, and vibration, which can affect tray performance .

- Space and Clearance: Leave room for airflow, maintenance, and future cable expansion .

- Structural Support: Verify that walls, ceilings, or floors can support the tray and cable weight; reinforcement may be needed for heavy loads .

Installation Sequence

- Route Planning: Mark the tray path according to electrical design, considering load, clearance, and separation of high- and low-power cables .

- Tray Selection: Choose the appropriate type (ladder, ventilated trough, solid-bottom, or wire mesh) based on cable type, load, and environmental conditions .

- Mounting Supports: Install brackets, trapeze hangers, or cantilever supports at proper intervals, typically 1.5–3 meters apart depending on tray type and load .

- Tray Installation: Align and secure trays, ensuring level and straight runs, and connect sections with fittings .

- Cable Laying: Once trays are installed, cables are pulled and organized, leaving slack for expansion and maintenance .

Compliance Considerations

All installations must follow NEC Article 392, including:

- Using tray-rated cables suitable for open-air environments .

- Maintaining proper fill limits (40% for power cables, 50% for control cables) to prevent overheating .

- Ensuring metallic trays are properly grounded if used as equipment grounding conductors .

- Keeping trays accessible and avoiding prohibited areas like hoistways . By installing cable trays at the correct stage—after structural completion but before major cable pulling—projects achieve safe, organized, and code-compliant electrical systems while minimizing future maintenance challenges .
